PROJECT PRESENTATION | ZOHO CREATOR

Restaurant Ordering & Kitchen Display System

A simpler way to take orders, manage the kitchen and track sales.

November 2026

Why does this system matter?

The project brings the restaurant's main daily activities into one connected application.

The problem

Paper slips, verbal updates and manual registers can lead to delays, errors and missing information.

The solution

A web-based ordering and kitchen system built using Zoho Creator and Deluge workflows.

The benefit

Orders, kitchen status, ingredient stock, payments and sales can be managed in one place.

Main aim: reduce repetitive manual work and make restaurant operations easier to follow.

What changes with the proposed system?

Existing manual system

- Orders written on paper slips
- Kitchen updates shared verbally
- Stock register updated by hand
- Bills and sales totals calculated manually
- Table availability tracked informally

Proposed digital system

- Orders entered through digital forms
- Kitchen follows a Kanban display
- Ingredient stock updated from recipes
- Automatic pricing and order totals
- Table status updated after payment

What did I build it with?

Zoho Creator provides the forms, database, reports and application pages.

Zoho Creator

Main low-code platform used to build and host the app.

Deluge

Scripts automate pricing, totals, stock and order status.

Lookup relationships

Connect related records across forms.

Nine linked forms

Group 1

Category • Menu_Item • Ingredient

Group 2

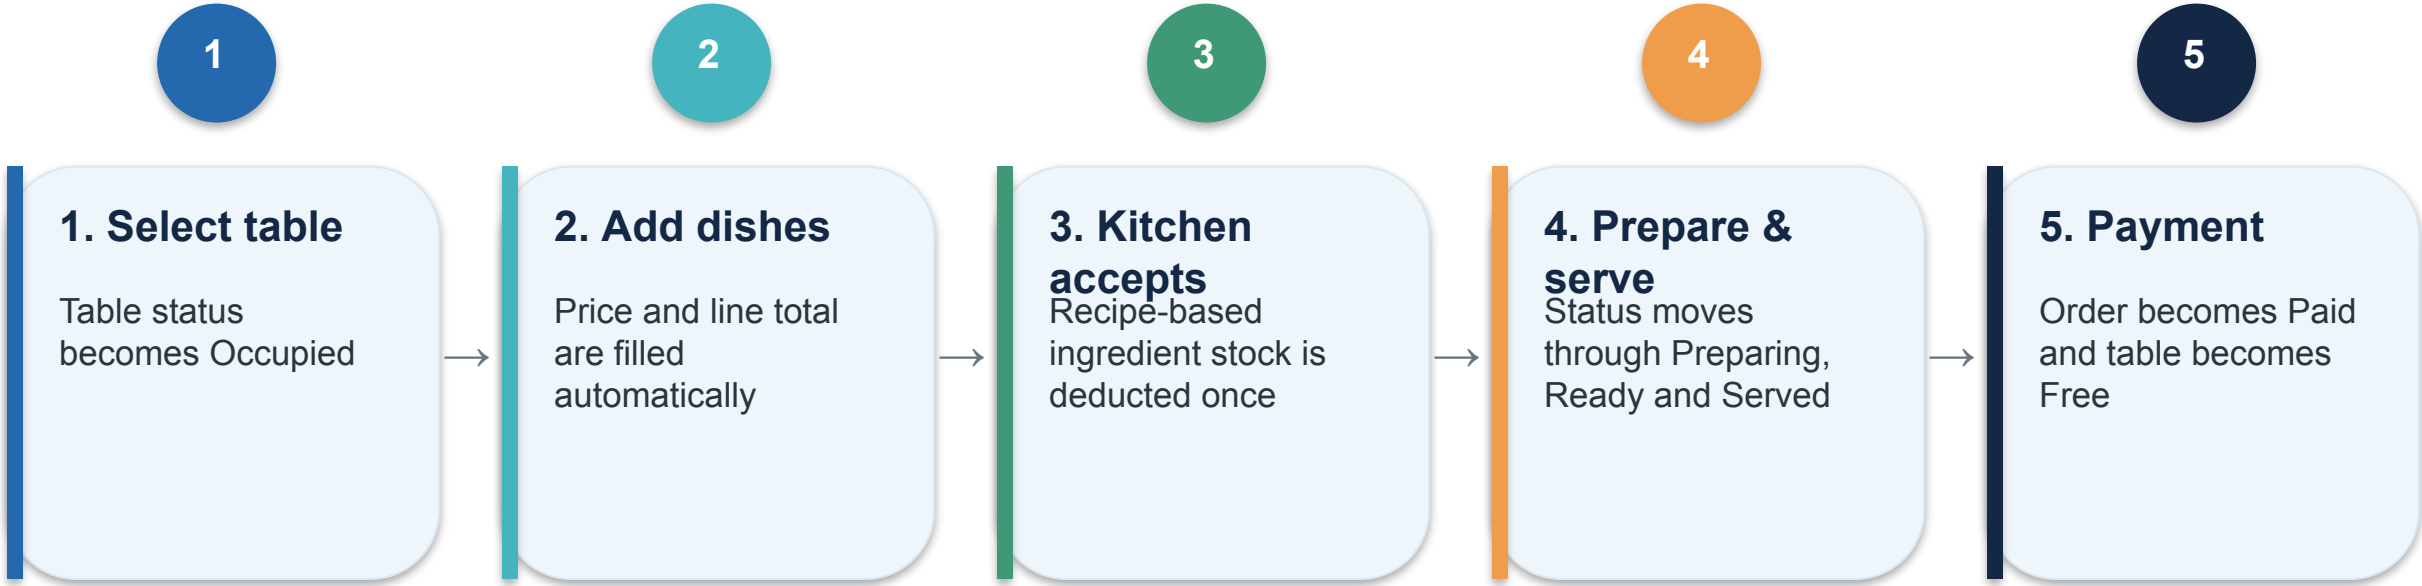

Recipe • Restaurant_Table • Order

Group 3

Order_Item • Payment • Purchase_Request

How does an order move through the system?

Each team updates the same order record as the customer journey progresses.

Placed → Accepted → Preparing → Ready → Served → Billed → Paid

What does the system handle automatically?

Automatic calculations

Fetches dish prices and updates line and order totals.

Availability validation

Stops users from ordering dishes marked unavailable.

Stock and purchase requests

Deducts recipe ingredients once and raises a request when stock is low.

Reports and dashboard

Kitchen Kanban, nine list reports, four pivot charts and sales KPI tiles.

The manager can use the dashboard to review top sellers, sales split, order status and revenue trends.

Was the application tested?

17 test cases

Sample data covered the main order-to-payment scenarios.

9 defects fixed

Issues found during development were corrected and logged.

Key safeguard

A stock-deduction flag prevents the same order from reducing stock twice.

The testing covered order entry, dish availability, kitchen status, stock deduction, payment and table release.

A smoother restaurant workflow — in one place.

The system digitises the order-to-payment process, reduces manual calculations, gives kitchen staff a shared order view, updates ingredient stock and helps the manager review sales.

Future enhancements

- QR-code customer ordering and online payments
- Supplier email / WhatsApp alerts
- Custom staff profiles and customer feedback
- Ingredient-demand forecasting

Thank you! | I’m happy to answer your questions.
